# cat .android\_history

- 2003: Gründung (A. Rubin, R. Miner, N. Sears, C. White)
- 2005: Akquisition durch Google
- 2008: HTC Dream
- 2013: A. Rubin => S. Pichai
- 2019: Android Q(10) != Nachtsch
- 2019: Java => Koitlin
- 2023: Container, k8s & Android :-)

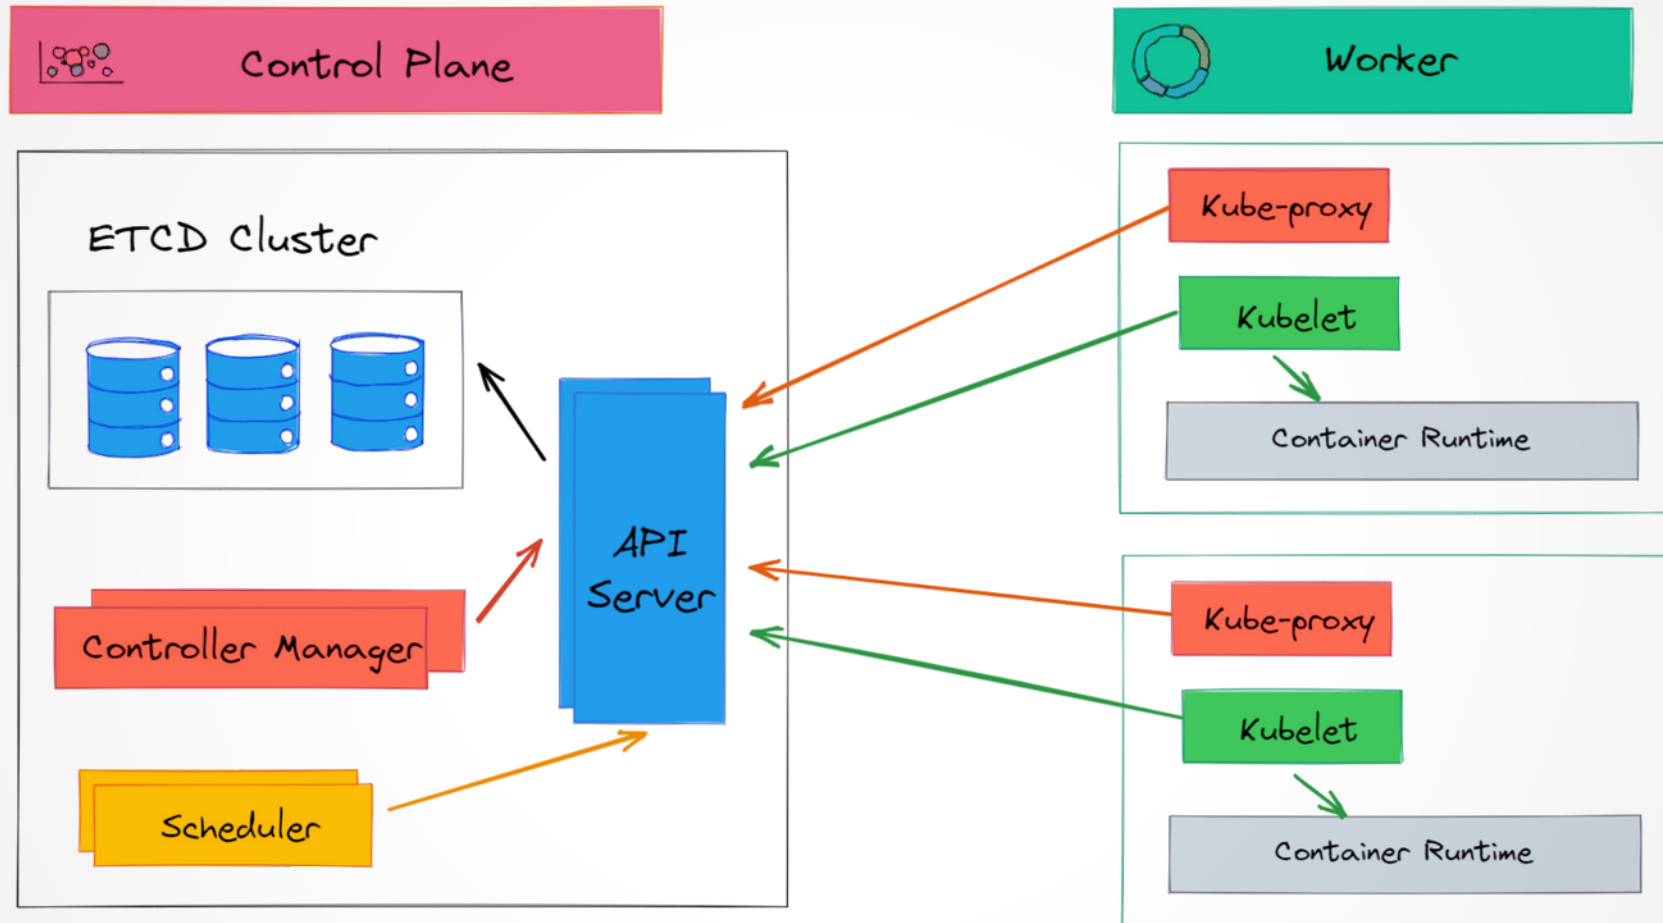

# man android

# man containerd

# man k8s

# cat /usr/share/ingredients

- Kernel-Konfiguration:

```
CONFIG_CGROUPS=y
```

```
# CONFIG_CGROUP_DEBUG is not set
```

```
CONFIG_CGROUP_FREEZER=y
```

```
# CONFIG_CGROUP_PIDS is not set
```

```
# CONFIG_CGROUP_DEVICE is not set
```

```
CONFIG_CGROUP_CPUACCT=y
```

```
CONFIG_CGROUP_SCHEDTUNE=y
```

```
# CONFIG_CGROUP_PERF is not set
```

```
CONFIG_CGROUP_SCHED=y
```

```
CONFIG_BLK_CGROUP=y
```

```
# CONFIG_DEBUG_BLK_CGROUP is not set
```

```
CONFIG_CGROUP_BPF=y
```

```
CONFIG_CGROUP_WRITEBACK=y
```

```
CONFIG_SOCK_CGROUP_DATA=y
```

```
# CONFIG_NETFILTER_XT_MATCH_CGROUP is not set

```
cat /usr/share/ingredients (ff.)
```

<https://termux.dev>

# cat /usr/share/ingredients (ff.)

- Neuere Android ( $\geq 11.0$ )
- Quad-/Octa-Core aarch64 (z. B. neuere Snapdragons)
- $\geq 4$  GB Hauptspeicher
- $\geq 4$  GB freier Flash o.ä.
- Linux/BSD Host

# cat /usr/share/recipe

1. Android SDK (für adb)

2. Termux (mittels F-Droid installieren!)

3. (scrcpy)

4. Termux:

`ssh` installieren & konfigurieren

`termux-setup-storage` (falls via `ssh`: zuerst Grant Storage Permission!)

5. In Termux:

```
pkg install qemu-utils qemu-common qemu-system-aarch64-  
headless wget curl bash
```

# cat /usr/share/recipe (ff.)

## 6. Alpine:

```
https://dl-cdn.alpinelinux.org/alpine/latest-stable/releases/aarch64/  
alpine-virt-*.iso
```

## 7. UEFI BIOS:

```
https://releases.linaro.org/components/kernel/uefi-linaro/latest/release/  
qemu64/QEMU_EFI.fd
```

## 8. Virt. Festplatte anlegen:

```
qemu-img create -f qcow2 alpine.img 10G
```

## 9. Alpine-Installation:

```
qemu-system-aarch64 -machine virt -cpu cortex-a57 -m 2048M -smp 6 -nographic -  
bios QEMU_EFI.fd -drive format=raw,readonly=on,file=storage/downloads/alpine-  
virt-3.xx.x-aarch64.iso -drive file=alpine.img,media=disk,if=virtio -netdev  
user,id=n0,hostfwd=tcp::2222-:22,dns=1.1.1.1 -device virtio-net,netdev=n0
```

# cat /usr/share/recipe (ff.)

10. In der VM: `/etc/udhcp/udhcp.conf` : `RESOLV_CONF="no"`

11. Zwei Nameserver konfigurieren, die UDP können:

```
/etc/resolv.conf: nameserver 8.8.8.8 \n nameserver 1.1.1.1
```

12. `setup-alpine`:

`openssh`: Allow root login / no key generation

`vdb` Disk-Option: `sys`

13. VM starten:

```
qemu-system-aarch64 -machine virt -cpu cortex-a57 -m 2048M -smp 6  
-nographic -bios QEMU_EFI.fd -drive file=alpine.img,media=disk,if=virtio  
-netdev user,id=n0,hostfwd=tcp::2222-:22,hostfwd=tcp:8080-:8080,dns=1.1.1.1  
-device virtio-net,netdev=n0
```

# cat /usr/share/recipe (ff.)

14. In der VM: Community-Repo konfigurieren und updaten

```
vi /etc/apk/repositories; apk update
```

15. k3s-Abhängigkeiten installieren:

```
apk add k3s --repository=https://dl-  
cdn.alpinelinux.org/alpine/edge/community
```

16. Services hinzufügen / löschen:

```
rc-update add iptables; rc-update add containerd;  
rc-update del k3s
```

17. Leere iptables-Konfiguration erzeugen:

```
/etc/init.d/iptables save
```

# cat /usr/share/recipe (ff.)

18. `reboot`

19. „Richtiges“ k3s installieren:

```
curl -sfL https://get.k3s.io |  
INSTALL_K3S_EXEC="--disable-cloud-controller  
--disable traefik -disable metrics-server" |  
sh-s
```

20. Standard k3s-Binary "umbiegen":

```
rm /usr/bin/k3s; ln -s /usr/local/bin/k3d /usr/bin
```

21. Services starten:

```
service [iptables containerd k3s] start;
```

# cat /usr/share/recipe (ff.)

## 22. kubectl installieren:

<https://kubernetes.io/docs/tasks/tools/install-kubectl-linux>  
(ARM64!)

```
chmod +x kubectl; mv kubectl /usr/local/bin
```

## 23. Pre-flight Check: Laufen Container (8 an der Zahl)?

```
ctr c list
```

## 24. Cluster-Authentifizierung:

```
mkdir ~/.kube; cp /etc/rancher/k3/k3s.yaml ~/.kube
```

## 25. Optional: Zugriff auf Control-Plane von aussen

```
# kubectl proxy -p 8080 -address=0.0.0.0
```

```
# adb forward tcp:8080 tcp:8080
```

(~/.kube/config entsprechend anpassen)

# md5sum

- k8s zum Mitnehmen
- VM vs. Geschwindigkeit
- Momentan: Work in Progress
- Todo:
  - Installation / Konfiguration Use Case (s. OSCon '23)
  - Custom Kernel mit vollständiger Container-Unterstützung?
  - Cluster mit mehreren Android-Geräten
  - Hybride k8s-Cluster (shipper/admiralty?)

# cat /usr/share/doc/etc.txt
